Project Executable Files

This section requires submission of all executable and deployable files for your project. Ensure all files are properly organized, named, and uploaded to the specified submission platform. The evaluator must be able to run or deploy your solution using the provided files and instructions.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	Yes
4	Database schema / seed files (if applicable)	NA (Flat-file system using CSV storage)
5	Environment configuration file (.env.example or similar)	NA
6	Deployed application URL (if hosted)	Yes (If locally hosted, mark as NA)
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Yes
10	Demo video or walkthrough (if required)	Yes

Step 2: File / Folder Structure

Provide an overview of your project's file and folder structure below:

Global-WellBeing-HDI-Predictor/	
├─ app.py	# Main Flask backend routing and core logic server
├─ HDI.pkl	# Serialized Machine Learning model binary weights
├─ HDI.csv	# Historical dataset used for analytical validation
├─ requirements.txt	# Python framework dependencies list
├─ README.md	# Comprehensive setup and project markdown guide
├─ templates/	# Frontend UI components directory
│ └─ index.html	# Main dashboard user interactive interface
└─ tests/	# Validation suite directory
└─ test_inference.py	# Basic functional prediction testing script

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	[Paste your live URL here if hosted on Render/Vercel, else type: Localhost Deployment Only]
Login Credentials (Demo)	NA (Public open-access portal designed for quick regional planning simulations without authentication bottlenecks)
Platform / Hosting Provider	Render / Local Machine (Select whichever applies to you)
Repository Link	https://github.com/cherish-codes/Global-WellBeing-HDI-Predictor
Demo Video Link	[Paste your screen-recording drive link or YouTube walk-through URL here]

Step 4: Run Instructions

Provide clear, step-by-step instructions for the evaluator to run your project locally:

Pre-requisites:

Python 3.9 or higher installed on a standard browser-capable office system.

Pip (Python package manager).

Internet connection for the initial dependency installations.

Step 1: Clone the repository: `git clone`

`https://github.com/cherish-codes/Global-WellBeing-HDI-Predictor.git`

Step 2: Navigate to the folder root and install dependencies: `pip install -r requirements.txt`

Step 3: Validate that your HDI.pkl and dataset source files sit cleanly in the main folder root directory.

Step 4: Launch the local micro-framework instance loop via terminal: `python app.py`

Step 5: Open your web browser and view the responsive input layouts at: `http://127.0.0.1:5000`

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	Default single-threaded backend server engine can create processing queues under dense, concurrent load tests.	Workaround: Optimized by calling model assets directly from memory spaces. Switching to an enterprise WSGI server production bundle handles multi-threading automatically.
2	Inputting negative metrics or non-numeric alphabetic symbols returns an internal exception code.	Status: Mitigated. Standard HTML5 form validation locks (type="number") and minimum value rules prevent user submission errors on the frontend layout.
