

## Project Demo Planning

|                      |                                     |
|----------------------|-------------------------------------|
| <b>Date</b>          | 4 July 2026                         |
| <b>Team ID</b>       |                                     |
| <b>Project Name</b>  | Comprehensive measure of well-being |
| <b>Maximum Marks</b> | 1 Mark                              |

### 1. Project Demo Planning Matrix

This distributes the presentation sections, assigning realistic time allocations and mapping technical ownership to team roles.

| S. No | Demo Section                       | Description                                                                                                              | Duration (mins) | Responsible Member           |
|-------|------------------------------------|--------------------------------------------------------------------------------------------------------------------------|-----------------|------------------------------|
| 1     | Introduction & Context             | Present the business case for real-time well-being estimates and the limitations of delayed statistical office cycles.   | 1.0 min         | Project Lead / Presenter     |
| 2     | UI Design & Theme Walkthrough      | Showcase the single-page glassmorphic interface design, input validation limits, and responsive layout panels.           | 1.5 mins        | Frontend Developer           |
| 3     | Predictor Engine & Simulator Run   | Execute live predictions (/predict) and compare volatile "what-if" policy simulation scenarios (/simulate) side-by-side. | 2.5 mins        | Data Scientist / ML Engineer |
| 4     | Backend Code & Architecture Review | Step through the app.py script, data boundary validation arrays, and explain the zero-server-footprint flat-file system. | 2.0 mins        | Backend Developer            |
| 5     | Live Tunnel Deployment Demo        | Demonstrate running the development container on port 5050 and launching the public evaluator URL via Ngrok.             | 1.0 min         | DevOps / Systems Engineer    |
| 6     | Roadmap & Q&A Conclusion           | Summarize future extensions (SQLite logs, time-series forecasting) and field direct questions from reviewers.            | 2.0 mins        | Full Project Team            |

## 2. Demo Flow Summary

This section outlines the operational step-by-step checklist to follow during the live execution of your evaluation video.

| Step | Activity                         | Notes                                                                                                                                                                                       |
|------|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Introduction & Problem Statement | Open the video with the dashboard landing view. Explicitly state how the application equips policymakers with immediate predictive indices to optimize funding before a release cycle.      |
| 2    | Solution Overview                | Briefly explain the lightweight system approach. Use your text-based ASCII structure to explain how data flows non-blockingly from JavaScript fetch requests directly to the HDI.pkl array. |
| 3    | Live Feature Demonstration       | Conduct the active browser walkthrough. Submit a baseline payload, slide an indicator to trigger a boundary constraint message, and render the horizontal feature coefficient bar charts.   |
| 4    | Q&A Session                      | Address core architectural choices. Be prepared to defend the exclusion of relational databases in favor of speed, and review the technical roadmap items for future production scaling.    |
